

## Full-Stack Test Architect Course

- > Behaviour Driven Development
- > Test Automation
- > Continuous Integration

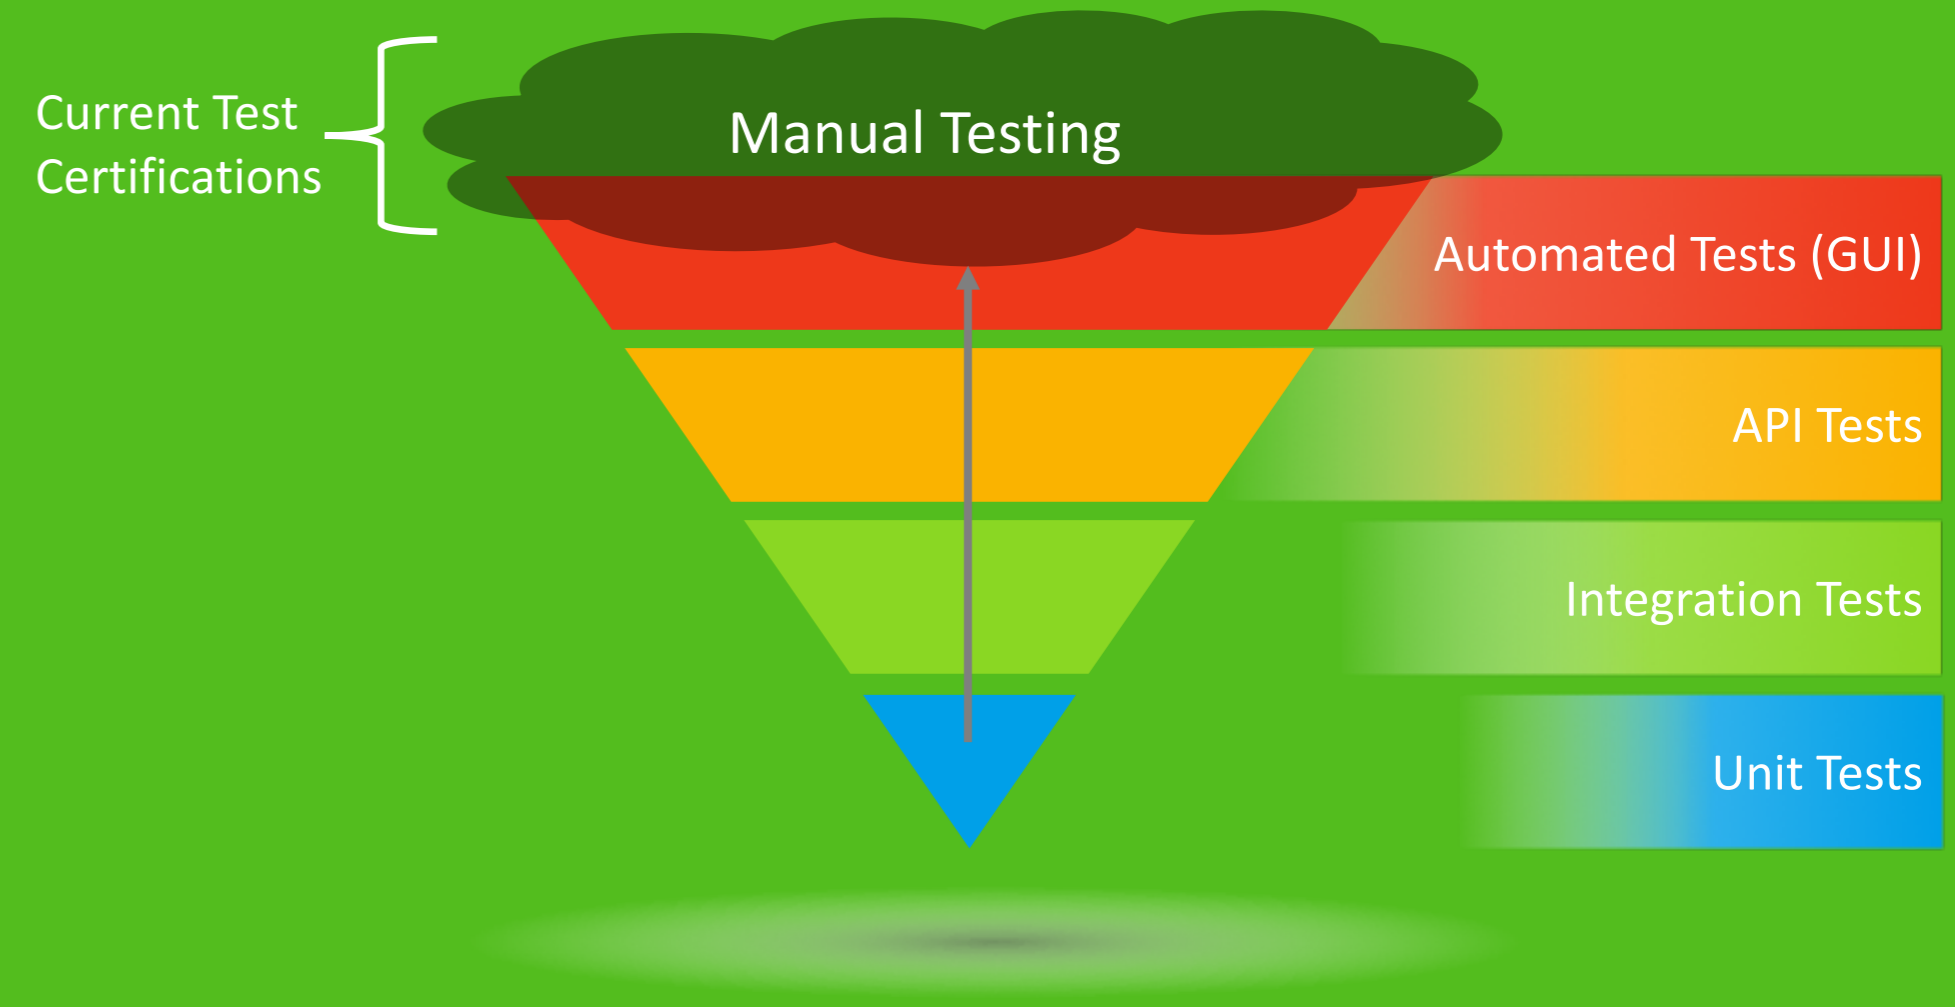

All in one course.

## Current Test Certifications encourage bad practices.

By concentrating on manual testing and theory, current certifications leave attendees without the required technical ability to implement a robust and automated test solution for an entire project.

The resultant anti-pattern of large amounts of manual testing at the end of the project results in missed deadlines and low quality products.

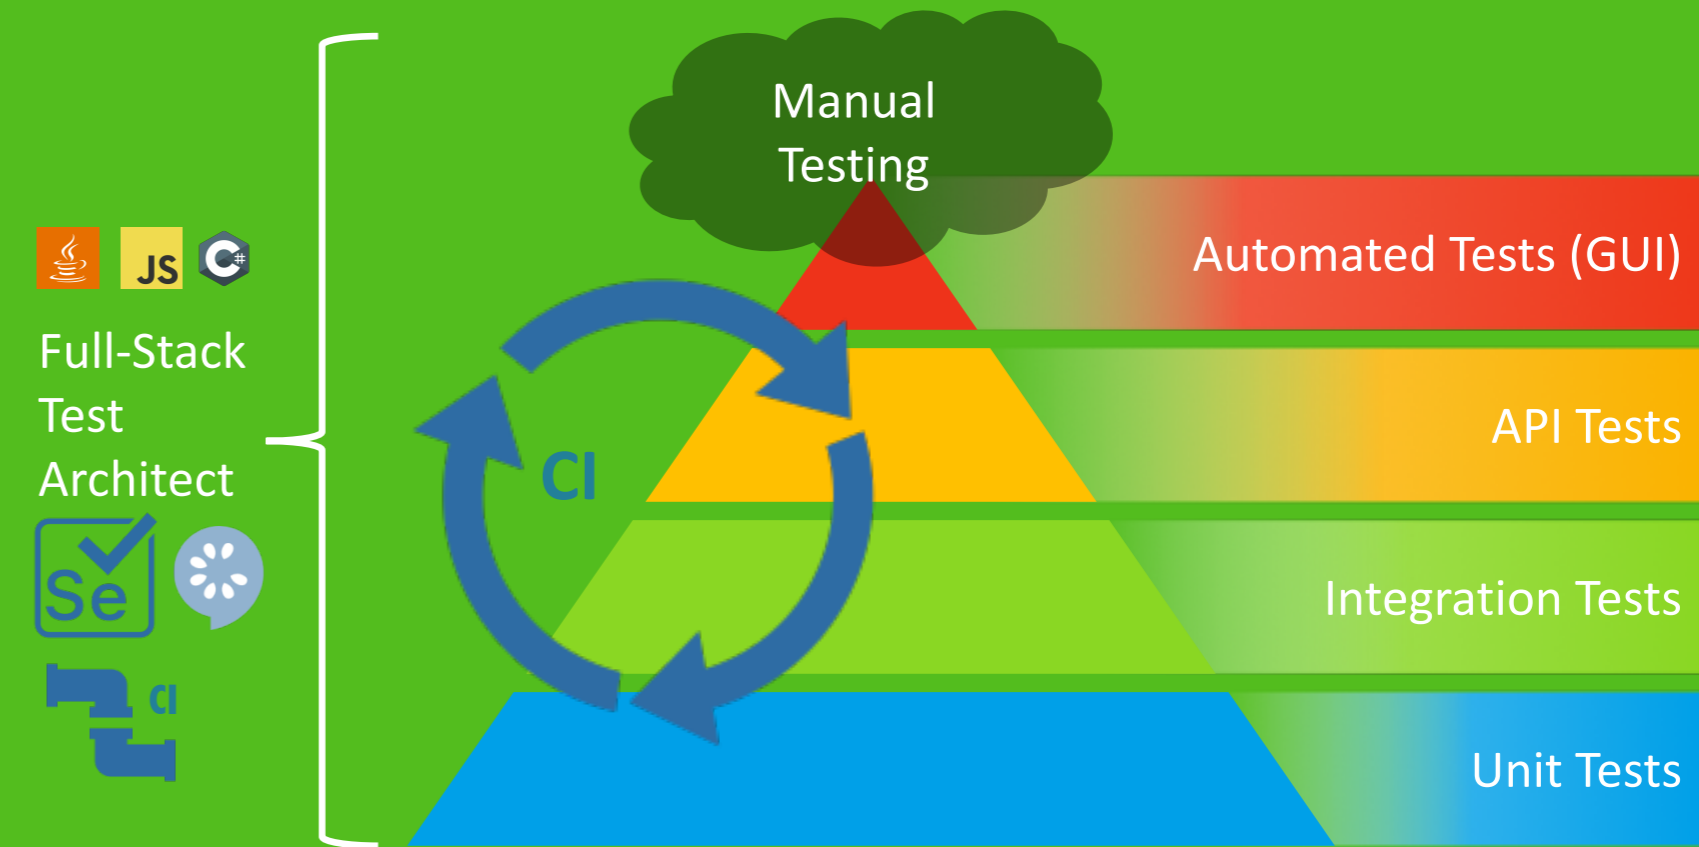

## A Hands-on Technical Certification

By contrast, Safebear's Full-Stack Test Architect course teaches the technical skills and knowledge that will have a real impact on your project.

Using the latest tools and techniques, attendees build their own test framework from unit tests all the way through to GUI automation.

Along the way, attendees will learn Behaviour Driven Development (BDD) and Continuous Integration (CI).

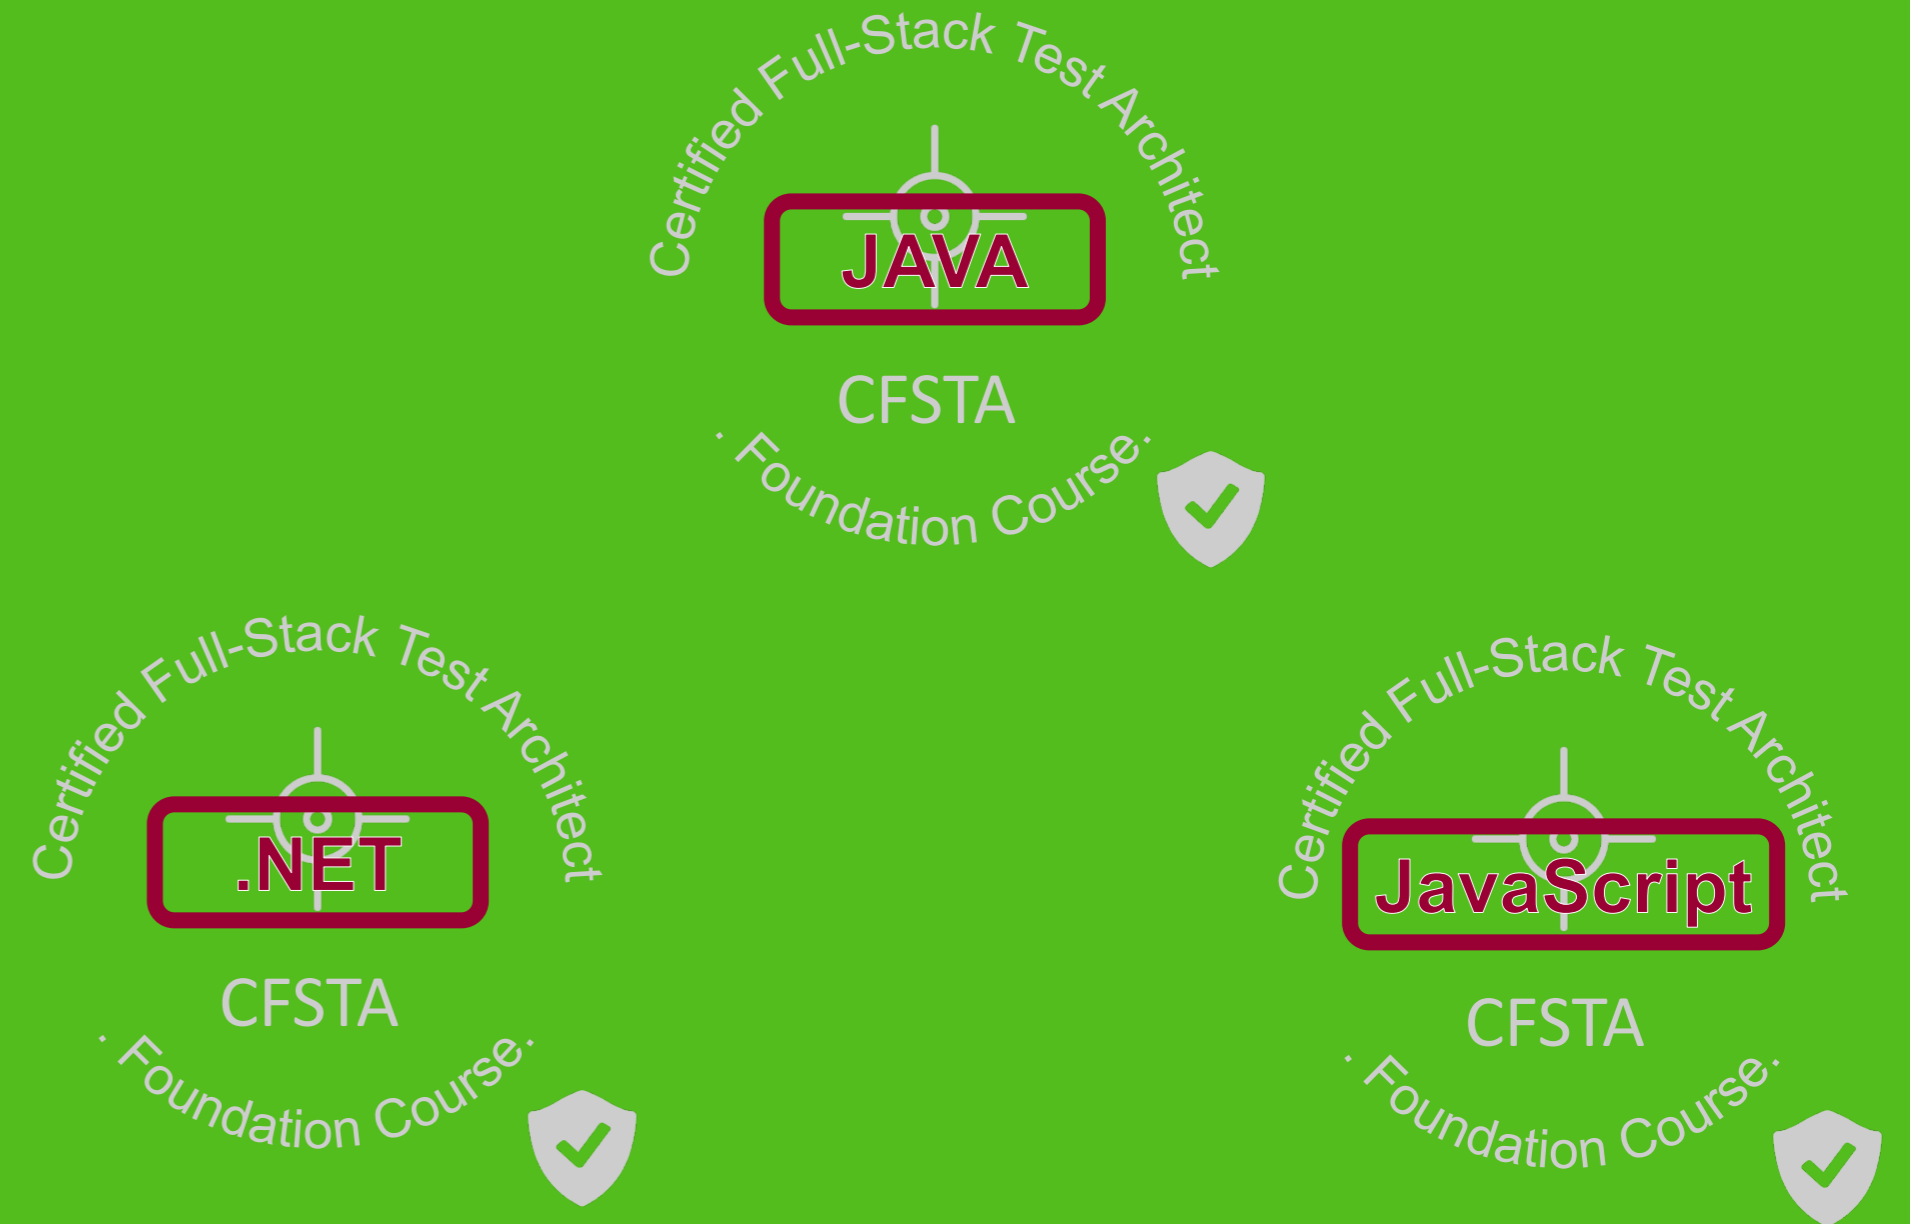

## Available in Three Flavours

The Full-Stack Test Architect course is available in the three key languages that currently dominate the application development industry.

- > Java
- > .NET
- > JavaScript

Safebear aims to make its certified alumni the most desirable employees in the IT marketplace.
