

VACCINE & VACCINATION

**WHY
WOULD
YOU
TAKE
IT?**

One of the demanding careers
A Course Loved by learners
Loved by professionals
Designed and Developed by experts

A vaccination is a biological preparation that gives people active acquired immunity against a specific infectious disease. A vaccination usually contains an agent that looks like a disease-causing germ and is manufactured from weakened or destroyed microbes, their toxins, or one of their surface proteins.

Vaccination, more than ever, is a safe and efficient strategy to prevent disease and save lives. At least 20 illnesses, including diphtheria, tetanus, pertussis, influenza, and measles, are now protected by immunisations. Every year, these vaccines help to save the lives of up to 3 million people.
